

xOVERTIME™

An Excel®-enabled cloud database for better data control, management and sharing

➤ **xOverTime** automates, secures, and simplifies the sharing of Excel workbook data. Workbook data now participates in the enterprise data structure just like data from other enterprise systems. The data is captured in a cloud database that is defined and managed directly from within current spreadsheets.

Share Data not Spreadsheets

xOverTime allows controlled data sharing as opposed to emailing spreadsheets and encouraging uncontrolled use. Data sourced from a workbook can now be accessed in an automated way by other systems. Your calculations are protected.

Keep Business Users in Control

With xOverTime, staff feel empowered and in control of their information and analytics, promoting acceptance and compliance. New trending and analysis “over time” capabilities, along with statistics on who is using their data and how frequently, add business value.

Powerful Excel Add-in

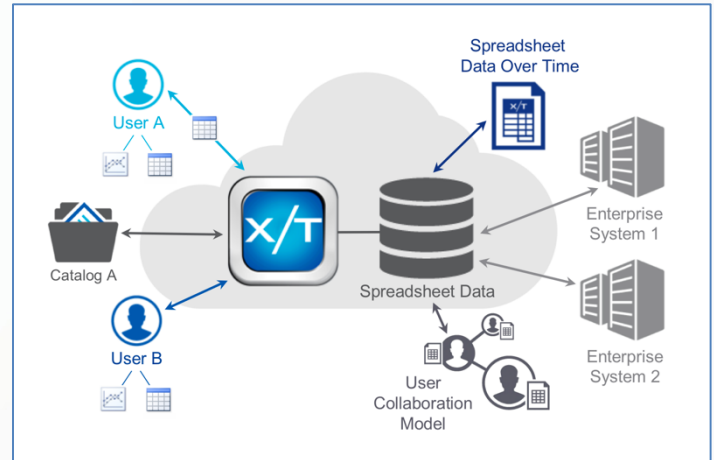

The xOverTime Excel Add-in is the most convenient way to take advantage of xOverTime’s functionality. Without leaving Excel, instantly upload or download data using an xOverTime template.

Flexible Data Entry and Reporting

Staff familiarity with Excel makes data definition, data entry and reporting flexible and powerful. xOverTime can leverage existing spreadsheet tabs to store and report data to and from xOverTime. Users have the power of Excel to change formats or chart types.

User-friendly Dashboard

Use the xOverTime web application to quickly visualize the data stored in the xOverTime database. Select a catalog to see trends of any of the variables. Zoom, scroll, export to Excel, create a jpeg or further filter the data for later analysis.

Business Benefits

- **Store your Excel data in a cloud database**
 - Easy to retrieve and trend over time
- **Improve Information Distribution**
 - Secure sharing with notifications of updates
 - Eliminate emailing spreadsheets and version control issues
- **Boost productivity and analysis**
 - Less time managing files
 - More time for business trending, comparisons and analytics
- **Improve Data Governance**
 - Less chance of using the wrong version
 - Less chance of data being emailed outside the company
- **Identify important data and who uses it**
 - Identify similarly named data from different sources
 - Key data use statistics

Connect Excel to the Enterprise Architecture

Many companies manage a huge amount of data solely in Excel, but spreadsheet centric solutions lack the structure needed to be part of the Enterprise Information Architecture. xOverTime adds that structure, plus API-level connectivity to enterprise applications.

Streamline Enterprise Data Sharing

Workbooks uploaded to the xOverTime database are securely stored and scanned to capture key data. Business owners share data items with others who can download them directly into their own workbooks and subscribe to future updates.

Capture Business IP

Complex workbooks often contain valuable Intellectual Property, and xOverTime protects that IP by storing both data and the workbooks used to generate it. It also improves business process reliability by automating the way input data is entered at specific process points.

Solve the Data Governance Problem

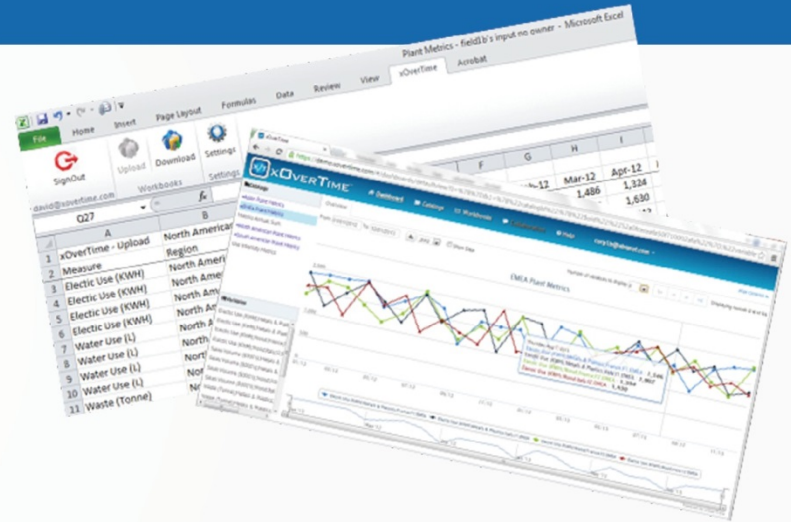

Distributing business data by emailing spreadsheets around is unsafe and real version control is impossible - files are easily copied and emailed, and stale copies remain in email inboxes. xOverTime secures this process, and alerts data consumers when new data is available.

Catalogs to Manage Data

Catalogs are used to organize and manage variables. Owners of data directly control who can access and download the information they own. Share catalogs with other users and populate catalogs with only the variables you want them to see.

Stage Excel Data for BI Tools

Data stored in xOverTime is also available for use in today's powerful business intelligence tools and data warehouses. All controlled from the familiar Excel interface.

xOverTime Adds Value for Enterprise IT

- **Deliver value to Excel-based business users**
 - Provide a robust backend for Excel-based business processes
 - Add new trending and analysis capabilities
- **Improve Data Governance**
 - Every source workbook is captured
 - Controlled sharing and distribution
- **Bring Excel-based data into the enterprise data architecture**
 - Add structure to unstructured spreadsheet data
 - Integrate with enterprise systems
- **Capture key results from Excel applications used to post-process enterprise data**
 - Capture the IP and outputs that go to management after CSV files are exported from SAP or other systems for post-processing
- **Identify the important data in the organization and track who uses it**
